## **Studebaker** SPECIAL-SIX TOURING

**A NEW LOW PRICE**

WHEREVER you look, you will find protection against hard wear built into the Studebaker Special-Six and this quality of construction is just as exacting down under the surface as it is where you can see every detail.

The skillful workmanship and the fine materials of these hidden values are largely responsible for its long-lived dependable service.

Two important elements that make the Special-Six notable for fine performance and comparative freedom from repair, are the four-bearing crankshaft and the seven-inch frame with its five cross-members and sub-frame support-

ing the motor and the separate transmission.

The new price, \$1275, is the lowest for which the Special-Six Touring Car ever sold—and the quality is better than ever.

Price does not always determine value, but in the case of Studebaker it establishes the finest values in the market. The name Studebaker on your car insures satisfaction.

Come in or phone and let us give you a demonstration in the Special-Six. Drive it yourself. A ride will help you make up your mind. In public confidence and respect, the name Studebaker stands higher than ever.

Rain-proof, one-piece windshield; coil lights; coil ventilator; massive head lamps; tonneau light with long extension cord; windshield wiper; eight-day clock; third gear transmission lock; tool compartment in left front door; outside and inside door handles.

## LIABLE

When Subjected to Heat or Fast Work Animals Sometimes Lose Consciousness and Fall.

In hot weather and when subjected to heat or fast work in the hot sun, horses sometimes lose consciousness and fall, or as it is commonly expressed, they have sunstroke.

Sunstroke differs from fits in the absence of excitement, the breathing is slow and often of a snoring character, the pulse is slow and indistinct. The harness should be removed and the horse placed in a comfortable position in the shade and propped up on his bridle. Cold water should be dashed on the head, or cracked ice in a bag be applied to the poll and the head elevated. If the horse is conscious enough to drink, small quantities of cool water should be offered frequently. Four ounces of whiskey may be given, diluted in cold water. The horse should be sponged

One Good Type of Covering to Protect Horses From Torture by Stable Fly.

with cool water and rubbed briskly all over till he is dry and rested. Plenty of fresh air should be allowed, without a draught.

The same treatment is to be given horses that have been overdriven in hot weather and are suffering from heat exhaustion.

## CLEAN BATH BEST FOR HOGS

Animals Will Show Appreciation by Making Profitable Gains If Given Chance.

Given a chance hogs will keep themselves clean. While we have come to associate these animals and muddy wallows, the fact of the matter is that the hogs are usually compelled to live in places where they cannot avoid the mud. If the premises are so arranged that the sows can keep the bodies washed off and at the same time stay out of the mud they will respond in gains as an expression of their appreciation for the opportunity to have regular clean baths.

## SUITABLE FEEDS FOR SWINE

Farmer Who Can Produce Large Crops of Barley, Kaffr or Milo Should Raise Hogs.

Many persons living in a section where good corn crops cannot be raised in an average season hesitate to raise hogs even if they can produce large crops of barley, feterita, kaffr or milo. For all practical purposes these feeds are just as good as corn for growing or fattening hogs, and anyone who can produce these crops can grow hogs.

## PROFIT IN HOME GROWN FEED

Closer Feeder Sticks to His Own Crops Better Showing Will Be Stock Returns.

A good rule for all farmers to follow is to feed what they raise as much as possible. Some purchased feeds will usually be necessary, but the closer the feeder sticks to his own crops, the better showing will be made when he figures up his profits on a bunch of pigs or cattle.

## TO MAKE HOG-RAISING PAY

Sanitation Must Be Provided, Together With Suitable Feed and Pure Water.

Filthy, damp or dusty quarters, for hogs are not disease breeders, but are disease builders. You must provide sanitary quarters, good feed, plenty of pure water, and those with pure bred stock and constant care means a profit at almost any price.

## Value of Protein.

Protein is the nutrient which makes young animals grow, repairs an old animal's body and which largely produces the finger nails or hair in humans, milk, meat, wool and horns in domesticated animals.

## Protecting the Pig Crop.

Give pigs special care after they have received double treatment against cholera. Through lowered resistance at this time they may get sick.

(Prepared by the United States Department of Agriculture)

That testing cattle for tuberculosis and the cleaning up of infected herds are having a permanent effect in reducing the extent of the disease is shown conclusively by figures recently collected by the United States Department of Agriculture from inspectors in charge of the eradication work in various parts of the country. The inspectors were asked to supply figures on the results of three or more tests on badly diseased herds, those that had not less than 10 per cent of reactors on the first test. The first test on more than 58,000 cattle in these herds showed that 26 per cent had tuberculosis. Another test six months later on the same herds, from which the reactors had been removed, showed only 6.9 per cent of the disease. By another six months the percentage had gone down to 2.8. A fourth test on more than 25,000 of these cattle showed only 1.8 per cent of tuberculosis.

The reports from which these figures were taken show that under normal conditions herds very badly diseased may be established as relatively free in a short time. They also show that eradication work can be carried on without destroying the cattle industry as is sometimes thought. Erratic results were obtained on a very few of the 1882 herds tested, the list of this class containing less than 100. Out of the 126,008 herds under

A Dairy Herd Certified by the Department of Agriculture as Free From Tuberculosis.

observation December 1, 1921, there were only a very few that had not shown satisfactory improvement as a result of testing.

## COWS REQUIRE MUCH WATER

It Should Be 20 Degrees Above Freezing Point and Same Temperature Every Day.

During the winter, when cows are stabled the greater part of the time, they should be watered two or three times a day, say specialists of the United States Department of Agriculture, unless arrangements have been made to keep water before them at all times. The water should, if possible, be 15 degrees or 20 degrees above the freezing point, and should be supplied at practically the same temperature every day. When water well above freezing temperature is stored in tanks and piped directly to the bow, there is probably little occasion for facilities to warm it. When it stands in a tank on which ice often forms, it usually pays well to warm it slightly. This can be done by a tank heater, by live steers, or by hot water from a boiler. If a boiler is used for running a separator or for heating water to wash and sterilize utensils, steam from it can readily and cheaply be used to warm the water.

## CREAMERY TAKES SAFE MILK

Vermont Association Accepts Product Only From Herds That Have Been Tested.

Increasing interest in the tuberculin testing of cattle is evident from reports received by the United States Department of Agriculture from many parts of the country. This tendency applies not only to milk used directly, but to manufactured dairy products. A co-operative creamery association at Barre, Vt., accepts milk and cream only from herds that have been tuberculin tested under federal and state supervision.

The products of the association's dairy plant are butter, cheese, ice cream, milk and cream, the products being sold both wholesale and retail. Specialists in the bureau of animal industry regard the increasing interest in tuberculin eradication as an important development in the dairy manufacturing industry.

## Warm Quarters for Cows.

Cows in winter should have access to warm quarters during stormy weather although they require exercise and should not be stabled all the time. Warm water is a great help in keeping the animals in good winter condition.

## Cow Needs Vacation.

After a season of steady, high pressure work, the dairy cow needs a six or eight week's vacation—not at the shore or in the mountains, but out in the quiet of the back pasture.

## BLACKBURN

Mr. and Mrs. J. C. Yarborough and family of Providence visited in this section the week end.

Rev. Woodall preached a fine sermon at this place Sunday.

Mr. and Mrs. Roy Joyce visited at Shady Grove Saturday and Sunday.

Mr. and Mrs. L. Seymore visited W. W. Hopkins and family Saturday.
